PROBLEMSTATEMENT:

Onlineshoppingsystem:

In day to day life, we will need to buy lots of goods or products from a shop. It may be food items, electronic items, house hold items etc etc. Now a days, it is really hard to get some time to go out andget them by ourselves due to busy life style or lots of works. In order to solve this, B2C E-Commercewebsites have been started. Using these websites, we can buy goods or products online just by visitingthe website and ordering the item online by making payments online. This existing system of buyinggoods has several disadvantages. It requires lots of time to travel to the particular shop to buy thegoods. Since everyone is leading busy life now a days, time means a lot to everyone. Also there are expenses for travelling from house to shop. More over the shop from where we would like to buysomething may not be open 24*7*365. Hence we have to adjust our time with the shopkeeper's time orvendor's time. In order to overcome these, we have e-commerce solution, i.e. one place where we canget all required goods/products online. The proposed system helps in building a website to buy, sellproducts or goods online using internet connection. Purchasing of goods online, user can choosedifferent products based on categories, online payments, delivery services and hence covering the disadvantages of the existing system and making the buying easierand helping the vendors to reachwidermarket. draw ausecasediagramforgiven scenario.

Login/Register:

- The user is a visitor, who visits the site and buy something from our website by making anonlinepayment(or)otherwise hecanregister.
- Bothcustomerandadminhavedifferenttaskinonlinesystem.

Admin:

Admin is a responsible person to run the whole system. Admin can add delete, update all information, orderinformation, item information.

Adminscenarios:

- Login module
- Manageitems
- Processaorder
